

PatchWise A2A - Executive One-

Pager

PURPOSE

PatchWise A2A automates patch review cycles using two agents (Builder +

Reviewer). The goal is faster turnaround, consistent review quality, and predictable

execution.

WHAT WAS BUILT

- Intake block for local patch, lore link/msgid, or session resume.
- Round orchestration: Builder -> Validation -> Reviewer -> Gate.
- Quality gates: findings validation + LGTM safety checks.

- Context continuity: prior findings/comments reused each round.

- Reporting: per-round and session-level artifacts.

- Respin support: next version generation ($vN \rightarrow vN+1$).

- Operational safety: worktree lock and optional email bridge.

EXISTING PATHS USED

- `.a2a/sessions/<session-id>.json`

- `.a2a/logs/<session-id>/`

- `.a2a/reports/<session-id>/`

- `.a2a/reports/<session-id>/session-report.html`

- `.a2a/patches/<session-id>/vN/`

- `.a2a/locks/worktrees/`

EXECUTIVE CALL FLOW

Input -> Session Init -> Builder Round -> Validation Gate -> Reviewer Round -

> **LGTM Gate -> (Pass: Finalize + Report + Respin) / (Fail: Next Round)**

BUSINESS VALUE

- Lower review cycle time through autonomous iteration.
- Better review consistency and decision clarity.
- Less rework from persistent session context.
- Improved handoff with complete artifacts.

PRIMARY USE CASES

- Pre-submit kernel patch quality gate.
- Lore review triage and response prep.
- Session handoff and interruption recovery.
- Remote control via email bridge.
- Patchset coherence checks across versions.

ESTIMATED TIME IMPACT (INDICATIVE)

Activity	Manual	A2A	Savings
3-round patch cycle	120-180 min	40-70 min	45-65%
Context rebuild after interruption	20-40 min	3-8 min	70-90%
Report/evidence packaging	25-45 min	5-12 min	65-85%
